

### Filters

#### amount | currency[:symbol]

Formats a number as a currency (ie \$1,234.56).

#### date | date[:format]

#### array | filter:expression

Selects a subset of items from array. Expression takes *string|Object|function()*

#### data | json

Convert a JavaScript object into JSON string.

#### array | limitTo:limit

Creates a new array containing only a specified number of elements in an array.

#### text | linky

Finds links in text input and turns them into html links.

#### string | lowercase

Converts string to lowercase.

#### number | number[:fractionSize]

Formats a number as text. If the input is not a number an empty string is returned.

#### array | orderBy:predicate[:reverse]

Predicate is function(\*)|string|Array. Reverse is boolean

#### string | uppercase

Converts string to uppercase.

You can inject the \$filter service and do *\$filter('filterName')(value[, optionalParam][, optionalParam])* in use it in your javascript.

### Services

#### \$anchorScroll

#### \$cacheFactory

compiledHtml = **\$compile**(html)(scope)

#### \$controller

#### \$cookieStore

#### \$document

**\$exceptionHandler**(exception[, cause])

**\$filter**(name)

**\$http**([ options])

**\$httpBackend**

**\$injector**

**\$interpolate**(text[, mustHaveExpression])

**\$locale**

**\$location**

**\$log**

**\$parse**(expression)

**\$provide**

**\$q**

**\$resource**(url[, paramDefaults][, actions])

**\$rootElement**

**\$rootScope**

**\$route**

**\$routeParams**

**\$routeProvider**

**\$sanitize**(html)

### Directives

**ng-app**="plaintext"

**ng-bind**[-html-unsafe]="expression"

**ng-bind-template**="string"

**ng-change**="expression"

**ng-checked**="boolean"

**ng-class**[-even/-odd]="string|object"

**ng-[db|]click**="expression"

**ng-cloak**="boolean"

**ng-controller**="plaintext"

<html **ng-csp**> (Content Security Policy)

**ng-disabled**="boolean"

<form**ng-form** name="plaintext"> | **ng-form**="plaintext"

**ng-hide**|show="boolean"

**ng-href**="plaintext{|string|}"

**ng-include**="string"<**ng-include** src="string" *onload="expression" autoscroll="expression"*>

**ng-init**="expression"

<input **ng-pattern**="regex" **ng-minlength** **ng-maxlength** **ng-required**

<input **ng-list**="delimiter|regex">

<input type="checkbox" **ng-true-value**="plaintext" **ng-false-value**="plaintext">

**ng-model**="expression"

**ng-mouse**[down|enter|leave|move|over|up]="expression"

<select **ng-multiple**>

**ng-non-bindable**

**ng-options**="select [as label] [group by group] for ([key,] value) in object|array"

**ng-pluralize**<**ng-pluralize** count="number" when="object" *offset="number"*>

**ng-readonly**="expression"

**ng-repeat**="([key,] value) in object|array"

<option **ng-selected**="boolean">

**ng-src**="string"

**ng-style**="string|object"

**ng-submit**="expression"

**ng-switch**="expression"<**ng-switch** on="expression">

**ng-switch-when**="plaintext"

**ng-switch-default**

**ng-transclude** templates

**ng-view**<**ng-view**>

**ng-bind-html**="expression"

**Bold** means the actual directive

*Italics* mean optional

Pipes mean either|or

Plaintext means no string encapsulation

<sup>Superscript</sup> means notes or context

<Brackets> mean tag compitibility

Lack of <brackets> means the attribute can apply to any tag

### Module

### Global Functions

**angular.bind**(self, fn, args)

Returns a function which calls function fn bound to self (self becomes the this for fn).

**angular.bootstrap**(element[, modules])

Use this function to manually start up angular application.

**angular.copy**(source[, destination])

Creates a deep copy of source, which should be an object or an array.

**angular.element**(element)

Wraps a raw DOM element or HTML string as a jQuery element.

**angular.equals**(o1, o2)

Determines if two objects or two values are equivalent.

**angular.extend**(dst, src)

Extends the destination object dst by copying all of the properties from the src object(s) to dst.

**angular.forEach**(obj, iterator[, context])

Invokes the iterator function once for each item in obj collection, which can be either an object or an array.

**angular.fromJson**(json)

Deserializes a JSON string.

**angular.identity**()

A function that returns its first argument. This function is useful when writing code in the functional style.

**angular.injector**(modules)

Creates an injector function that can be used for retrieving services as well as for dependency injection.

**angular.isArray**(value)

Determines if a reference is an Array.

**angular.isDate**(value)

Determines if a value is a date.

**angular.isDefined**(value)

Determines if a reference is defined.

**angular.isElement**(value)

Determines if a reference is a DOM element (or wrapped jQuery element).

**angular.isFunction**(value)

Determines if a reference is a Function.

**angular.isNumber**(value)

Determines if a reference is a Number.

**angular.isObject**(value)

Determines if a reference is an Object. Unlike typeof in JavaScript, nulls are not considered to be objects.

**angular.isString**(value)

Determines if a reference is a String.

**angular.isUndefined**(value)

Determines if a reference is undefined.

**angular.lowercase**(string)

Converts the specified string to lowercase.

**angular.mock**

Namespace from 'angular-mocks.js' which contains testing related code.

**angular.module**(name[, requires], configFn)

<b>\$scope</b> <i>See \$rootScope</i>
<b>\$templateCache</b>
<b>\$timeout</b> (fn[, <i>delay</i> ][, <i>invokeApply</i> ])
<b>\$window</b>

## Directive Definition Object

<b>name</b> <i>{string}</i>
Name of the current scope. Optional defaults to the name at registration.

<b>priority</b> <i>{integer}</i>
Specifies order multiple directives apply on single DOM element (higher = first)

<b>terminal</b> <i>{true}</i>
Current <i>priority</i> will be last set of directives to execute

<b>scope</b> <i>{true   object}</i>
<i>True</i> - create child scope. <i>Undefined/false</i> - use parent scope. <i>{}</i> - isolate scope (with specified attributes/scope variables passed): <i>@</i> or <i>@attr</i> - bind local model to value of DOM attribute (string), = or = <i>attr</i> - bi-directional binding between local model and the parent scope, & or & <i>attr</i> - execute an expression in context of parent. Reference attr OR assumes model of same name

<b>controller</b> <i>function(\$scope, \$element, \$attrs, \$transclude)</i>
Controller constructor function instantiated before pre-linking phase and shared with other directives if requested by name

<b>require</b> <i>{string   array[string]}</i>
Require another controller ( <i>ngModel</i> ). Prefixes: <i>?</i> - Don't raise error. <i>^</i> - Look on parent elements too

<b>restrict</b> <i>{string: 'EACM'}</i>
<b>E - Element:</b> <code>&lt;my-directive /&gt;</code> . <b>A - Attribute</b> (default): <code>&lt;div my-directive="exp" /&gt;</code> . <b>C - Class:</b> <code>&lt;div class="my-directive: exp;" /&gt;</code> . <b>M - Comment:</b> <code>&lt;!-- directive: my-directive exp --&gt;</code>

<b>template</b> <i>{string}</i>
Replace current element with contents and migrates all attributes / classes

<b>templateUrl</b> <i>{string}</i>
Same as <i>template</i> but the template is loaded from the specified URL

<b>replace</b> <i>{boolean}</i>
<i>true</i> : template replaces element instead of appending

<b>transclude</b> <i>{boolean}</i>
Compiles contents on parent (pre-isolate) scope. Usually used with ngTransclude & templates.

<b>compile</b> <i>function(tElement, tAttrs, inTransclude(function(scope, cloneLinkingFn) returns link())</i>
For transforming the template (rare, run once per template instance).

<b>link</b> <i>function(scope, iElement, iAttrs, controller)</i>
Executed after template is cloned (run once per clone). Contains most logic (DOM listeners, etc). <i>Controller</i> can be an array.

<http://docs.angularjs.org/guide/directive>

<b>config(configFn)</b>
Use this method to register work which needs to be performed on module loading.

<b>constant(name, object)</b>
Because the constant are fixed, they get applied before other provide methods.

<b>controller(name, constructor)</b>
--------------------------------------

<b>directive(name, directiveFactory)</b>
--

<b>factory(name, providerFunction)</b>
--

<b>filter(name, filterFactory)</b>
------------------------------------

<b>provider(name, providerType)</b>
-------------------------------------

<b>run(initializationFn)</b>
Use this method to register work which needs to be performed when the injector with the current module is finished loading.

<b>service(name, constructor)</b>
value(name, object)

<b>name</b>
Name of the module.

<b>requires</b>
Holds the list of modules which the injector will load before the current module is loaded.

<http://docs.angularjs.org/api/angular.Module>

## Scope Properties and Methods

<b>\$root</b> or <b>\$rootScope</b>
Move to the top-most \$scope (ng-app)

<b>\$parent</b>
Move to the immediate parent of the current \$scope

<b>\$id</b>
Auto generated Unique ID

<b>\$destroy</b> (event)
Broadcasted when a scope and its children are being destroyed

<b>\$apply(exp)</b>
Executes logic within the AngularJS context and refreshes all models checks.

<b>\$broadcast(name, args)</b>
Dispatches an event name downwards to all child scopes

<b>\$destroy()</b>
Removes the current scope (and all of its children) from the parent scope

<b>\$digest()</b>
Process all of the watchers of the current scope and its children. Since watchers can change models, they will continue firing until all changes stop. <b>BEWARE OF RECURSIVE CODE</b>

<b>\$emit(name, args)</b>
Dispatches an event name upwards through the scope hierarchy

<b>\$eval(expression)</b>
Executes the expression on the current scope and returns the result

<b>\$evalAsync(expression)</b>
Executes the expression on the current scope at a later point in time

<b>\$new(isolate)</b>
Creates a new child scope

<b>\$on(name, listener)</b>
Listens on events of a given type

<b>\$watch(watchExp, listener(newVal, oldVal, scope), objectEquality)</b>
---

The angular.module is a global place for creating and registering Angular modules. Requires argument always creates a new module.
---

<b>angular.noop()</b>
A function that performs no operations.

<b>angular.toJson(obj[, pretty])</b>
Serializes input into a JSON-formatted string.

<b>angular.uppercase(string)</b>
Converts the specified string to uppercase.

<b>angular.version</b>
An object that contains information about the current AngularJS version.

## FormController

\$pristine
\$dirty
\$valid
\$invalid
\$error
<a href="http://docs.angularjs.org/api/ng.directive:form.FormController">http://docs.angularjs.org/api/ng.directive:form.FormController</a>

## NgModelController

\$render()
Called when the view needs to be updated. It is expected that the user of the ng-model directive will implement this method.
\$setValidity(validationErrorKey, isValid)
\$setViewValue(value)
\$viewValue
\$modelValue
\$parsers
array of function after reading val from DOM to sanitize / convert / validate the value
\$formatters
array of functions to convert / validate the value
\$error
object
\$pristine
boolean
\$dirty
boolean
\$valid
boolean
\$invalid
boolean

<http://docs.angularjs.org/api/ng.directive:ngModel.NgModelController>

## Deferred and Promise

<b>\$q.all([array of promises])</b>
Creates a Deferred object which represents a task which will finish in the future.

<b>\$q.defer()</b>
Creates a Deferred object which represents a task which will finish in the future.

<b>\$q.reject(reason)</b>
Creates a promise that is resolved as rejected with the specified reason

<b>\$q.when(value)</b>
Wraps an object that might be a value or a (3rd party) then-able promise into a \$q promise

<b>Deferred.resolve(value)</b>
Resolves the derived promise with the value

<b>Deferred.reject(reason)</b>
--------------------------------

#### **objectQuantity**

Watch a model (exp) for changes and fires the listener callback. Pass *true* as a third argument to watch an object's properties too.

The following directives create child scopes: *ngInclude*, *ngSwitch*, *ngRepeat*, *ngController*, *uiif*. Calls to the same *ngController* will create multiple instances and **do not** share scopes. Remember to traverse up the tree to affect *primitives* on the intended scope: *ng-click="\$parent.showPage=true"*

| Rejects the derived promise with the reason

#### **Deferred.promise**

| Promise object associated with this deferred

#### **Promise.then(successCallback, errorCallback)**

[http://docs.angularjs.org/api/ng.\\$q](http://docs.angularjs.org/api/ng.$q)
